Master the Basics and Beyond

THE PHYSICS OF ICE SKATING SMARTER EVERY DAY
 Smarter Every Day You'll be a Smarter Every Day
 COULD YOU BE A SKATER?

1 COEFFICIENT OF FRICTION

- The coefficient of friction (μ) for an ice skater is 0.0046 for a straight path and 0.0059 in a curve.
- Scientists don't know what causes the low friction.
- 2 theories are Pressure Melting and frictional heating.
- Both theories state that a thin layer of fluid is created between the skate and ice.

A SPEED SKATER'S LEAN TOWARDS THE INSIDE OF A TURN IS DUE TO CENTRIFUGAL ACCELERATION

LARGER INERTIA SLOWER ROTATION

SMALLER INERTIA FASTER ROTATION

2 ANGULAR MOMENTUM

- During a spin, angular momentum (L) is constant and is equal to angular velocity (ω) times the Moment of Inertia (I)

$$L = I\omega$$

THIS SKATE IS RAISED OR GLISSING ON THE ICE

DIRECTION OF MOTION

THIS SKATE IS PUSHING AWAY THE ICE

3 NEWTON'S 3RD LAW

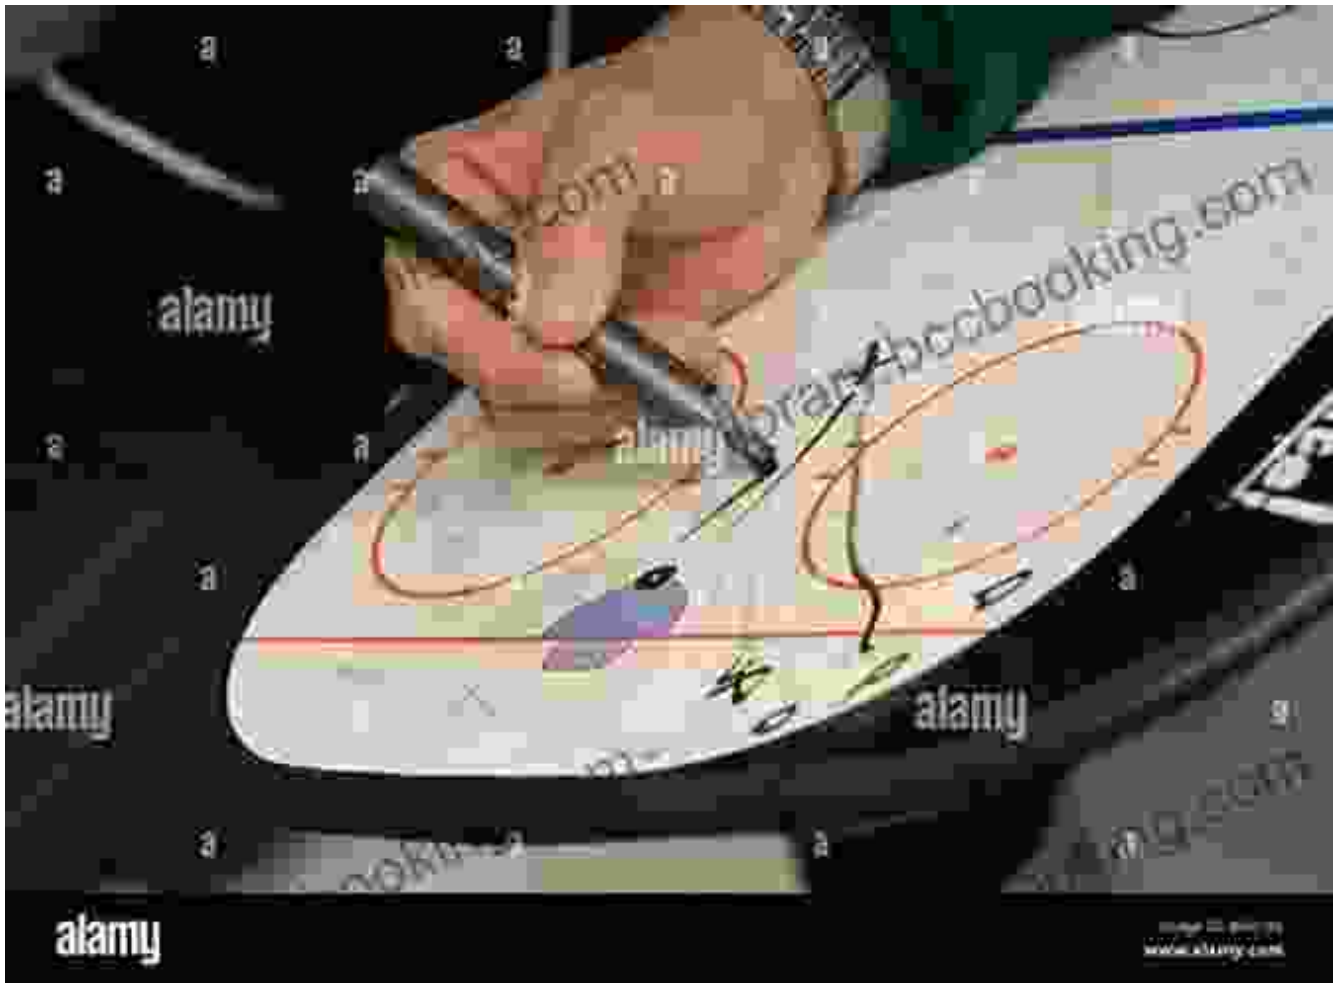

- For every action there is an equal and opposite reaction.
- To accelerate a skater's blade must be at an angle perpendicular to the direction of motion.
- As push off the ice with greater force, the skater increases the angle (θ) which increases the component of force in the direction of motion.
